

Education

Stanford University, *PhD in Economics*

2016-2021 (expected)

- **Research Interests:** Causal Inference, Statistical Learning Methods, Applied Microeconomics
- **Teaching:** Introduction to Statistical Methods, Economics of Health and Medical Care

Wellesley College, *BA in Economics*

2014

Magna Cum Laude, Honors in Economics

Research

Estimating Causal Effect of Air Pollution on Academic Performance (Summary)

I analyze causal effect of air pollution on academic performances of Korean elementary/middle/high school students in 2009-2016 using an instrumental variable approach. I use wind direction as source of variation to evaluate the causal effect of air pollution, exploiting unique geography of Korea where pollution matters from China exogenously vary depending on wind direction.

Causal Inference Under Covariate Shift via Worst-case Subpopulation Treatment Effects

with Hongseok Namkoong (PDF) Journal version under review

Conference version appeared in Conference on Learning Theory (COLT), 2020

Although most datasets severely lack diversity, standard causal approaches that estimate the average treatment effect ignore underrepresented groups. We propose a worst-case treatment effect that guarantees uniformly good performance across all subpopulations of a given size. We develop an estimation approach that allows flexible use of ML models, and uses them conservatively to guard against brittle causal findings that are invalidated by unanticipated covariate shifts.

The Effect of Delayed Retirement Credit on Social Security Claiming and Employment

with Mark Duggan, Irena Dushi, and Gina Li (*in progress*) (Summary)

We investigate the effect of changes in the delayed retirement credit (DRC) on workers' decisions to claim retired-worker benefits. We use micro-level Social Security Administration data to quantify the effect on social security claiming, and its interaction with labor market participation.

Employment

Lyft, Research Science Intern

2020

- Investigated long term heterogeneous treatment effects of Lyft's coupon program, and performed subgroup analysis for riders with disparate treatment effects
- To infer long term business impacts, developed a surrogate modeling approach that predicts long term outcome based on short term outcome, a more flexible improvement to the default long term multipliers

Stanford Economics, Research Assistant

2017-2018

- Estimated effect of social insurance created by family ties using instrumental variable approach
- Analyzed a data set of more than 10 million Swedes, including demographic, labor market, and pharmaceutical information from 1985-2013

MIT Economics, Research Assistant

2015-2016

- Managed a randomized control trial studying the effect of full college tuition scholarship on academic achievement of students attending post secondary institutions in Nebraska
- Applied semi-parametric statistical methods to estimate causal effect of the scholarship

National Bureau of Economic Research, Research Assistant

2013-2015

- Applied diff-in-diff approach to estimate spillover effect of rent decontrol in Cambridge, MA in 1996
- Acquired and cleaned data on crime and city budget from the Cambridge Police Department
